

Artur Smirnov

SENIOR GO ENGINEER — PAYMENT CORE & HIGH-LOAD

Serbia · open to remote worldwide & relocation | English B2 | paladei702@gmail.com | Telegram [@smironovarturr](https://t.me/smironovarturr) | [Book a 30-min intro call](#)

SUMMARY

Senior Go engineer with **4.5 years** building **payment-core, high-load distributed systems** where correctness under failure is non-negotiable — **exactly-once idempotent payouts, saga orchestration without 2PC**, and **transactional outbox** pipelines moving high-volume transaction flow without double-spend. Cut incident **MTTR 3h→45min** and payment **error rate 2%→0.5%** by rebuilding observability end-to-end with OpenTelemetry, Prometheus, Grafana, and Jaeger.

CORE SKILLS

Languages & APIs: Go (Golang), SQL, gRPC, REST, Protobuf, OpenAPI 3

Distributed Systems & Payments: microservices, distributed systems, event-driven architecture, saga pattern, idempotency, exactly-once processing, transactional outbox, eventual consistency, payment processing, payouts, PSP integration, circuit breaker, retry with backoff & jitter, dead-letter queue (DLQ), optimistic locking

Data & Messaging: PostgreSQL, Kafka, ClickHouse, Redis, RabbitMQ

Infrastructure: Kubernetes, Docker, CI/CD, Linux

Observability: OpenTelemetry, Prometheus, Grafana, Jaeger, distributed tracing, SLO, MTTR

Practices: code review, mentoring, on-call

Languages spoken: English — B2 (professional working proficiency), Russian — native

EXPERIENCE

- Senior Go Engineer** — YooMoney (fintech, payment platform) Jan 2024 – Present · Remote
 - Designed a **saga-based payout flow without 2PC**, backed by strict **idempotency keys** — eliminated double-spend risk from retries, duplicate deliveries, and partial failures, delivering **exactly-once settlement** on money movement.
 - Built a **transactional outbox → Kafka → ClickHouse** pipeline that moved analytical and event traffic off the production ledger database, cutting **PostgreSQL load by ~30%**.
 - Hardened integrations with unstable external PSPs — **circuit breakers, retry with exponential backoff and jitter, dead-letter queues** — turning flaky downstream providers into predictable, consistent transaction outcomes.
 - Rebuilt observability end-to-end with **OpenTelemetry, Prometheus, Grafana, and Jaeger** and SLO-based alerting — cut incident **MTTR from 3h to 45min** and payment **error rate from 2% to 0.5%**; drove code review and mentored engineers on distributed-systems and consistency patterns.
- Go Engineer** — Domclick (fintech / proptech, payment events) 2023 · Remote
 - Owned **idempotent processing** of payment-event webhooks end-to-end, with deduplication so repeated deliveries always reconcile to a single consistent state.
 - Modeled contracts and payments as an auditable **state machine with full audit trail**, publishing state changes through a **transactional outbox to Kafka** for downstream consumers.
 - Defined **HMAC-signed webhook contracts** adopted across the payments integration surface, closing a class of replay and tampering risk.
 - Instrumented webhook success rate, **outbox lag**, and retry/DLQ health so integration issues surfaced before they reached customers.
- Go Engineer** — Cian (large-scale real estate marketplace) Feb 2022 – Dec 2022 · Remote
 - Built the listing-management backend and **partner-synchronization** services (REST, OpenAPI 3) powering marketplace-scale traffic.
 - Designed **PostgreSQL schemas for audit trail and idempotency** on partner callbacks, using unique constraints and optimistic locking to keep data consistent under concurrent updates.
 - Implemented resilient **RabbitMQ worker** pipelines with exponential backoff and dead-letter queues for asynchronous processing at scale.

EDUCATION

Southern Federal University — B.Sc., Computer Science & Engineering

2025
